

Limbajul SQL – aplicatii

- Proceduri si functii stocate
- Tranzactionare
- Utilizarea declansatoarelor (trigger)
- Aplicatie: o aplicatie bancara simplificata

SQL

Aplicatie: aplicatie bancara simplificata

DDL: Trigger

DML: Update, Insert

Proceduri si functii stocate

Sintaxa pentru comenzi utilizate

Trigger

```
CREATE [DEFINER = { user | CURRENT_USER } ]
      TRIGGER trigger_name trigger_time trigger_event
      ON tbl_name
      FOR EACH ROW trigger_stmt
```

```
DROP TRIGGER [IF EXISTS]
[schema_name.] trigger_name
```

Update

```
UPDATE [LOW_PRIORITY] [IGNORE] tbl_name
      SET col_name1=expr1|DEFAULT} [, col_name2=expr2|DEFAULT} ] ...
      [WHERE where_condition]
      [ORDER BY ...]
      [LIMIT row_count]
```

SQL

Insert

```
INSERT [LOW_PRIORITY | DELAYED | HIGH_PRIORITY] [IGNORE]
       [INTO] tbl_name [(col_name, ...)]
       {VALUES | VALUE} ({expr | DEFAULT}, ...), (...), ...
       [ ON DUPLICATE KEY UPDATE
         col_name=expr [, col_name=expr] ... ]
```

```
INSERT [LOW_PRIORITY | DELAYED | HIGH_PRIORITY] [IGNORE]
       [INTO] tbl_name
       SET col_name={expr | DEFAULT}, ...
       [ ON DUPLICATE KEY UPDATE
         col_name=expr [, col_name=expr] ... ]
```

```
INSERT [LOW_PRIORITY | HIGH_PRIORITY] [IGNORE]
       [INTO] tbl_name [(col_name, ...)]
       SELECT ...
       [ ON DUPLICATE KEY UPDATE
         col_name=expr [, col_name=expr] ... ]
```

SQL

Proceduri si functii stocate

```
CREATE [DEFINER = { user | CURRENT_USER }]  
PROCEDURE sp_name ([proc_parameter[,...]])  
[characteristic ...] routine_body
```

```
CREATE [DEFINER = { user | CURRENT_USER }]  
FUNCTION sp_name ([func_parameter[,...]])  
RETURNS type [characteristic ...] routine_body
```

proc_parameter:

```
[ IN | OUT | INOUT ] param_name type
```

func_parameter:

```
param_name type
```

type:

Any valid MySQL data type

characteristic:

```
LANGUAGE SQL | [NOT] DETERMINISTIC | { CONTAINS  
SQL |  
NO SQL | READS SQL DATA | MODIFIES SQL DATA } |  
SQL SECURITY { DEFINER | INVOKER } | COMMENT  
'string'
```

Aplicatia bancara simplificata

Descriere

Aplicatia gestioneaza conturile clientilor unei bani.

Operatiunile permise sunt:

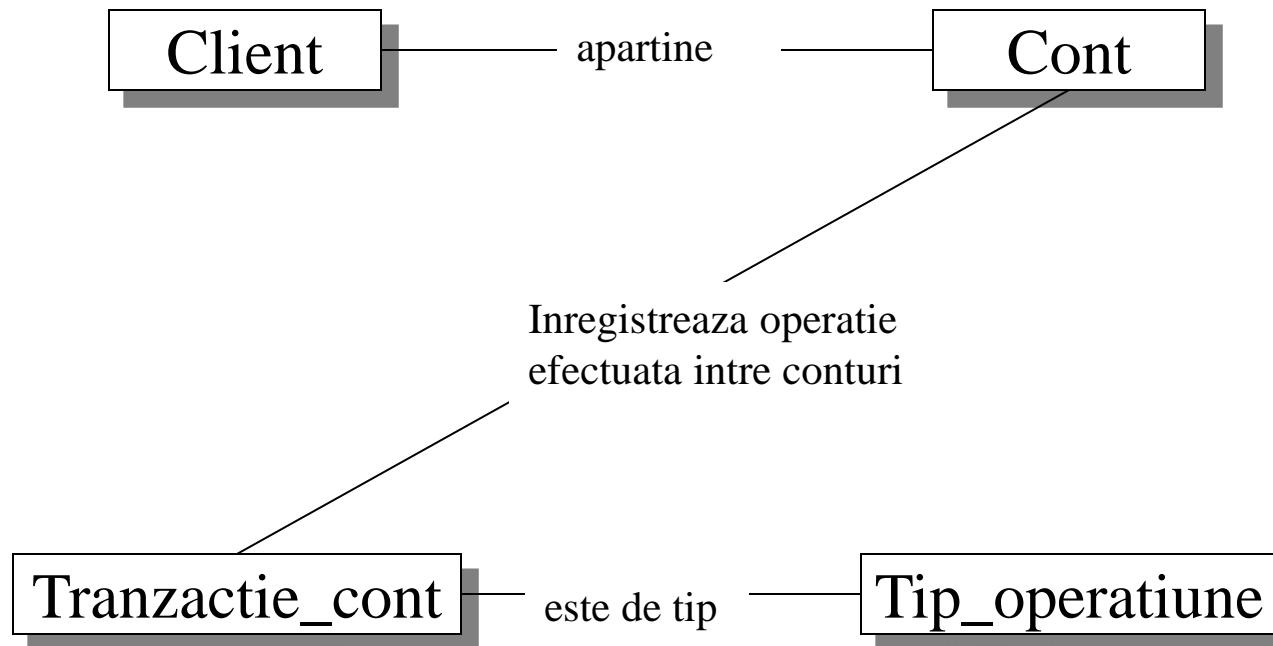

- Deschidere cont,
- Inchidere cont,
- Transfer intre conturi,
- Depunere ghiseu,
- Depunere ATM,
- Extragere ghiseu,
- Extragere ATM,
- Balanta cont,
- Istoric tranzactii;

Erorarea de tranzactionare:

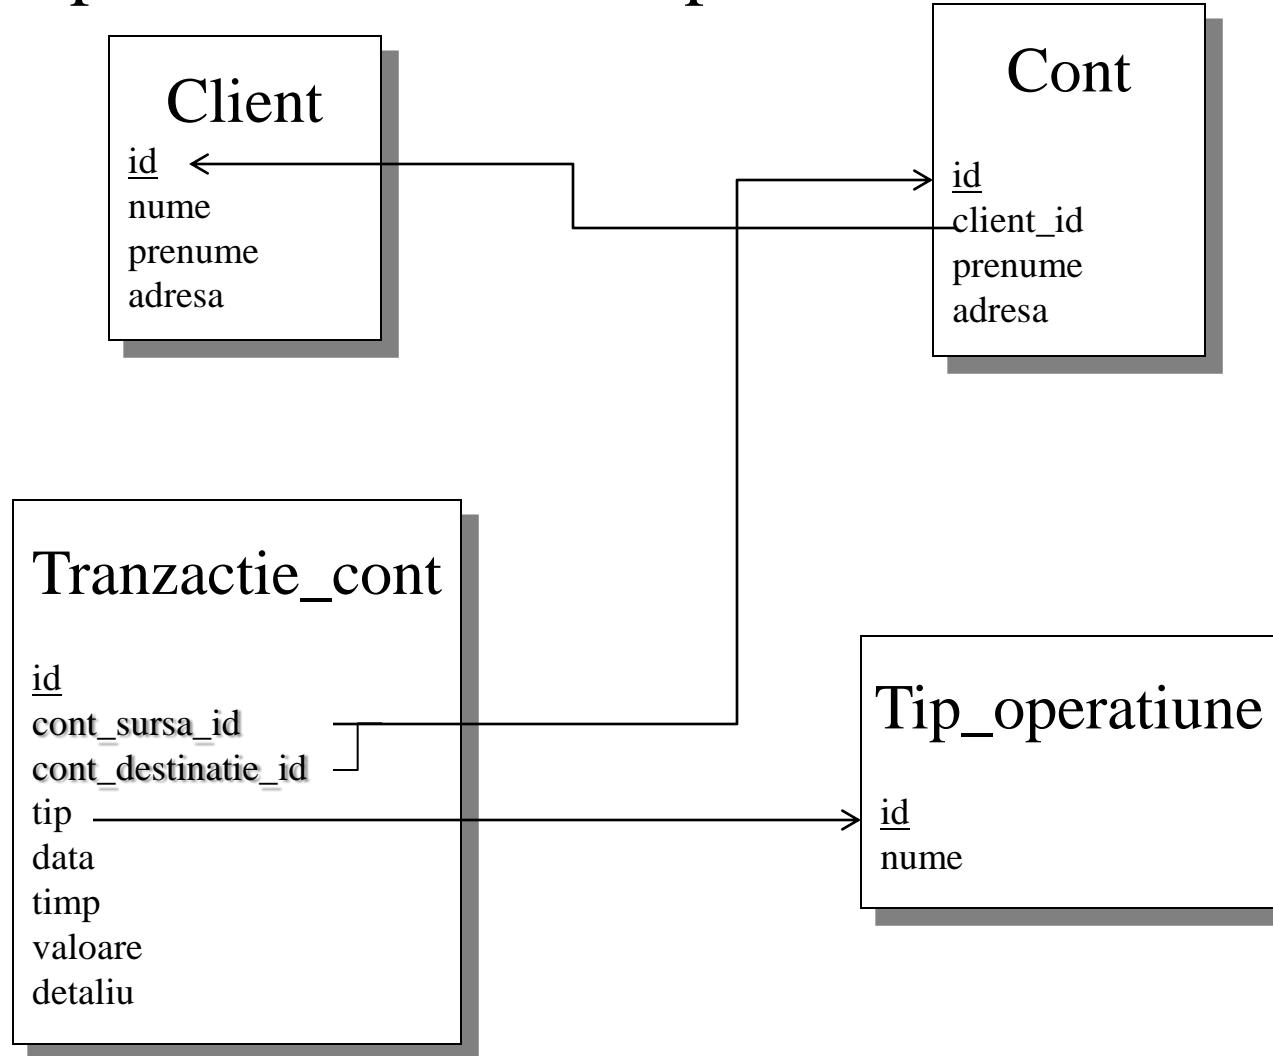

- TR_ERR: cont creditor insuficient;

Aplicatia bancara simplificata

Modelul entitate-relatie

Aplicatia bancara simplificata

Aplicatia bancara simplificata

Implementare

- ❑ Informatiile despre conturile clientilor sunt stocate in tabela **client**; informatiile despre conturile clientilor sunt stocate in tabela **cont**;
- ❑ Tipurile de operatiuni sunt stocate in tabela (nomenclator) **tip_operatiune**; tabela **tranzactie_cont** stocheaza informatiile despre operatiunile execute, inclusiv despre operatiuni de interogare precum ‘Istoric tranzactii’;
- ❑ Operatiunile care implica transferuri intre conturi sunt execute in interiorul unor tranzactii.
- ❑ Logica operatiunilor este implementata folosind:
 - Triggere (pentru creare cont la crearea unui client);
 - Proceduri stocate (pentru diferite operatiuni);
- ❑ Se utilizeaza triggere pentru unele operatiuni care trebuie inregistrate automat (vezi exemple mai jos).

SQL

Aplicatie bancara simplificata

Crearea tabelelor bazei de date

```
##-----  
##  
## creare tabele client, cont, tip_operatiune, tranzactie_cont  
##  
##-----  
create DATABASE IF NOT EXISTS d;  
USE d;  
DROP TABLE IF EXISTS cont;  
DROP TABLE IF EXISTS client;  
CREATE TABLE IF NOT EXISTS client  
(id int unique auto_increment primary key,  
nume char(20),  
prenume char(20),  
adresa char(50));  
  
CREATE TABLE IF NOT EXISTS cont  
(id int unique auto_increment primary key,  
client_id int,  
cod int,  
valoare float,  
FOREIGN KEY (client_id) REFERENCES client(id));  
  
CREATE TABLE IF NOT EXISTS tip_operatiune  
(id int unique auto_increment primary key,  
nume char(40));  
  
CREATE TABLE IF NOT EXISTS tranzactie_cont  
(id int unique auto_increment primary key,  
cont_sursa_id int,  
cont_destinatie_id int,  
tip int,  
data date,  
timp time,  
valoare float,  
detaliu char(20),  
FOREIGN KEY (cont_sursa_id) REFERENCES cont(id),  
FOREIGN KEY (cont_destinatie_id) REFERENCES cont(id),  
FOREIGN KEY (tip) REFERENCES tip_operatiune(id));
```

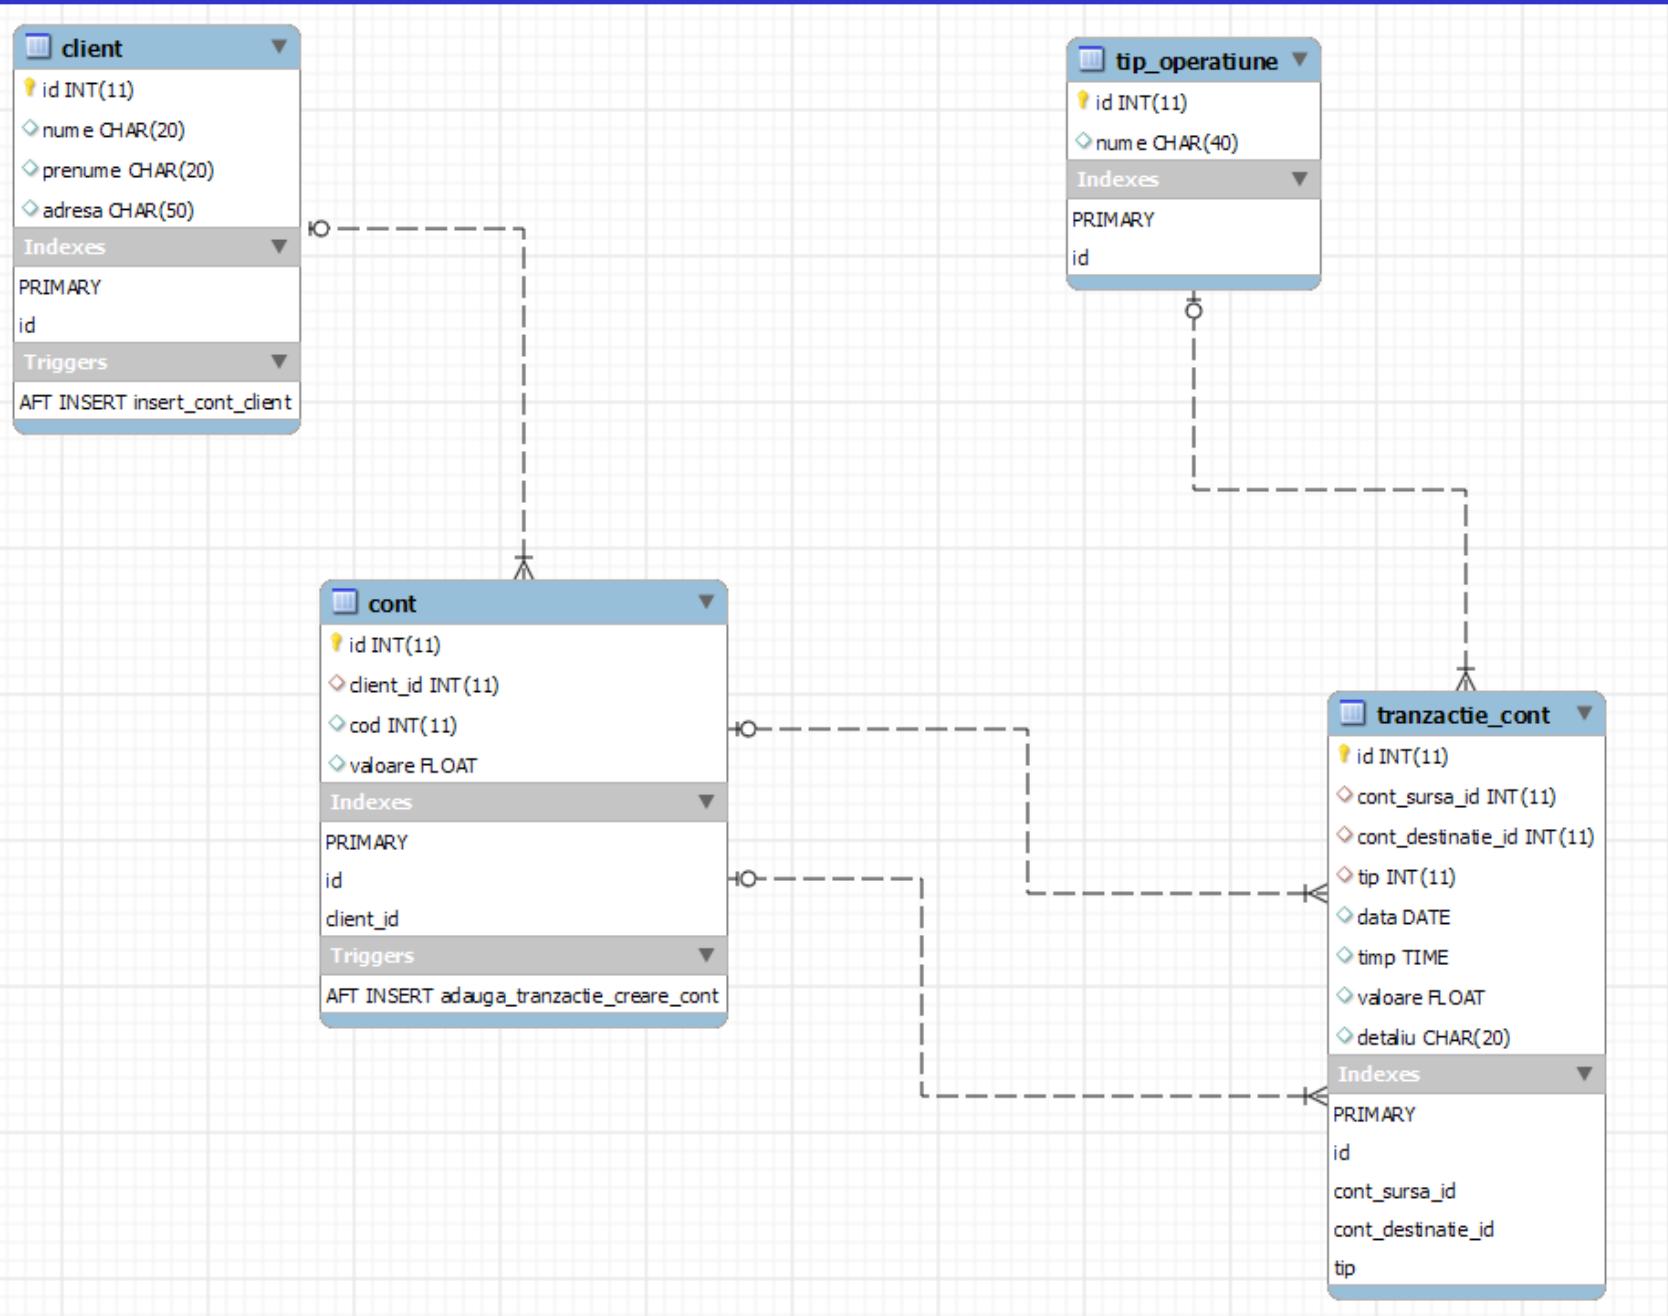

SQL

Triggere-le (declansatorii) sunt folosite pentru doua scopuri in aceasta aplicatie:

- (1) La creearea unui client, i se creeaza automat si un cont. Clientii sunt creati prin adaugarea unei noi inregistrari in tabela de client; trigger-ul este ‘insert_cont_client’, declanseaza dupa INSERT in tabela client si are ca efect inserarea unei noi inregistrari in tabela cont.
- (2) La adaugarea unei inregistrari in tabela cont (la creearea unui cont), se adauga o inregistrare de tip ‘Deschidere cont’ in tabela ‘tranzactie_cont’, tabela care inregistreaza toate tranzactiile/operatiunile care au loc.

Am preferat ca alte tipuri de modificari ale ‘cont’ si ‘tranzactie_cont’ sa nu utilizeze trigger pentru modificari corespunzatoare in tabela complementara, incluzandu-le in cadrul unor tranzactii, pentru un control mai strans.

```
##-----  
##  
## creare trigger  
##  
##-----  
  
## - Trigger AFTER INSERT tabela client  
## Este folosit pentru a adauga automat un cont pentru noul client  
DROP TRIGGER IF EXISTS insert_cont_client;  
  
delimiter //  
  
CREATE TRIGGER insert_cont_client AFTER INSERT ON client  
FOR EACH ROW BEGIN  
    INSERT INTO cont (client_id, cod, valoare) VALUES(NEW.id, NEW.id * 100);  
    END; //  
  
delimiter ;  
  
## - Trigger AFTER INSERT tabela cont  
## Este folosit pentru a adauga o inregistrare pentru creearea contului,  
## in tranzactie_cont  
DROP TRIGGER IF EXISTS adauga_tranzactie_creare_cont;  
  
delimiter //  
  
CREATE TRIGGER adauga_tranzactie_creare_cont AFTER INSERT ON cont  
FOR EACH ROW BEGIN  
    INSERT INTO tranzactie_cont  
(cont_sursa_id, cont_destinatie_id, tip, data, timp, valoare) VALUES  
(NEW.id, NEW.id, |  
    (SELECT id from tip_operatiune WHERE nume = 'Deschidere cont'),  
    CURRENT_DATE(), NOW(), 0);  
    END; //  
  
delimiter ;
```

SQL

```
##  
## inserare data in tabelele de client, tip_operatiune  
##  
##  
insert into tip_operatiune  
(nume)  
VALUES  
('Deschidere cont'),  
('Inchidere cont'),  
('Transfer intre conturi'),  
('Depunere ghiseu'),  
('Depunere ATM'),  
('Extragere ghiseu'),  
('Extragere ATM'),  
('Balanta cont'),  
('Istoric tranzactii'),  
('TR_ERR: cont creditor insuficient');  
  
INSERT INTO client  
(nume, prenume, adresa)  
VALUES  
('Popa', 'Ion', 'Str. Mare, Dabuleni, Ilfov'),  
('Popescu', 'Maria', 'Blvd. Primaverii, Bucuresti'),  
('Andreescu', 'Victor', 'Blvd. Iuliu Maniu, Bucuresti'),  
('Predescu', 'Andreea', 'Str. Virtutii, Baia Mare'),  
('Ionescu', 'Mihaela', 'Str. Visinilor, Bucuresti'),  
('Dinu', 'Cornel', 'Calea Victoriei, Bucuresti'),  
('Vodafone', 'S.A', 'Bucuresti'),  
('Romtelecom', 'S.A', 'Bucuresti');
```

```
mysql> select * from tranzactie_cont where tip = 1;
```

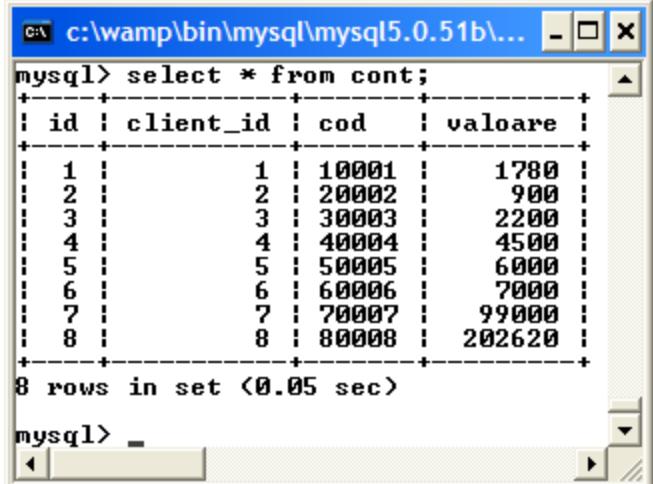

id	cont_sursa_id	cont_destinatie_id	tip	data	timp	valoare	detaliu
1	1	1	1	2008-12-14	12:07:47	0	NULL
2	2	2	1	2008-12-14	12:07:47	0	NULL
3	3	3	1	2008-12-14	12:07:47	0	NULL
4	4	4	1	2008-12-14	12:07:47	0	NULL
5	5	5	1	2008-12-14	12:07:47	0	NULL
6	6	6	1	2008-12-14	12:07:47	0	NULL
7	7	7	1	2008-12-14	12:07:47	0	NULL
8	8	8	1	2008-12-14	12:07:47	0	NULL

Populare tabele

Nu se populeaza tabelele 'cont' si 'tranzactie_cont':

In tabela 'cont' se creeaza automat, utilizand primul trigger, inregistrarile corespunzand clientilor creati in tabela 'client';

In tabela 'tranzactie_cont' se creeaza automat, utilizand al doilea trigger, inregistrarile corespunzatoare creerii conturilor.

```
c:\ c:\wamp\bin\mysql\mysql5.0.51b\... - □ x  
mysql> select * from cont;  
+----+-----+-----+-----+  
| id | client_id | cod | valoare |

| 7 | 7 | 70007 | 99000 |  
| 8 | 8 | 80008 | 202620 |  
+----+-----+-----+-----+  
8 rows in set (0.05 sec)  
  
mysql> _
```

Procedura alimentare cont

```
DELIMITER //  
  
CREATE PROCEDURE ALIMENTARE_CONT(cont_destinatie_cod int, valoare_depunere float)  
  
BEGIN  
    START TRANSACTION;  
    SELECT @ID_D := id FROM cont WHERE cod = cont_destinatie_cod;  
    SELECT @VAL := valoare FROM cont WHERE id = @ID_D;  
    SELECT @ID_TIP := id FROM tip_operatiune WHERE nume = 'Depunere ghiseu';  
  
    IF(@ID_D IS NOT NULL) THEN  
        BEGIN  
            INSERT INTO tranzactie_cont  
            (cont_sursa_id, cont_destinatie_id, valoare, tip, data, timp,detalii)  
            VALUES  
            (NULL, @ID_D, valoare_depunere, @ID_TIP, CURRENT_DATE(), NOW(),'Depunere ghiseu');  
  
            UPDATE cont SET valoare = valoare + valoare_depunere WHERE id = @ID_D;  
  
            COMMIT;  
        END;  
  
        ELSE ROLLBACK;  
    END IF;  
END //  
DELIMITER ;
```

Procedura primește ca parametrii codul contului destinatie și valoarea depunerii; tipul operatiunii este ‘Depunere ghiseu’; tranzacția constă în 2 operațiuni complementare:

- înregistrarea unei tranzacții în tabela ‘tranzactie_cont’ și
- creșterea soldului contului accesat cu aceeași valoare (tabela ‘cont’).
- Tranzacția este finalizată numai dacă se operează cu un cont destinatie existent; altfel, se face rollback (tranzacția este anulată)

SQL

Procedura alimentare cont

```
c:\wamp\bin\mysql\mysql5.0.51b\bin\mysql.exe
```

```
mysql> CALL ALIMENTARE_CONT(10001,2000);
```

```
+-----+

```

Procedura se aplica contului 10001 pentru a se alimenta contul cu 2000 lei; este un cont asupra caruia s-au efectuat deja mai multe operatiuni (operatiunea curenta este ultima listata). In tabela de tranzactii apare inregistrata depunerea numerar la 19:56. 14 Pentru listarea tranzactiilor, se utilizeaza procedura istoric_tranzactii (vezi mai jos).

DELIMITER ;

```

Procedura primește ca parametru codul contului debitat și valoarea extragerii; tranzacția este fie finalizată, cu transferul efectuat (contul există și suma există în cont), fie tranzacția este finalizată iar transferul esuat (cont existent dar suma insuficientă), fie tranzacția nu este finalizată (cont inexistent, se face rollback).
