

# SQL

**Aplicatie:** dictionar si tezaur multilingv

**DDL:** Trigger, Cursor

**DML:** Update, Insert

Proceduri si functii stocate

## Trigger

```
CREATE [DEFINER = { user | CURRENT_USER }]  
      TRIGGER trigger_name trigger_time trigger_event  
      ON tbl_name  
      FOR EACH ROW trigger_stmt
```

```
DROP TRIGGER [IF EXISTS]  
[schema_name.] trigger_name
```

## Cursor

```
DECLARE cursor_name CURSOR FOR select_statement
```

```
OPEN cursor_name
```

```
FETCH cursor_name INTO var_name [, var_name] ...
```

```
CLOSE cursor_name
```

# SQL

Aplicatia gestioneaza un dictionar si tezaur multilingv

Entitatile cu care se opereaza sunt: limba, concept, tezaur si dictionar;

Pentru fiecare entitate se creeaza un tabel.

In tabela ‘limba’ sunt grupate limbile in care sunt disponibile traduceri; tabela ‘concept’ cuprinde toate conceptele (sau notiunile) pentru care exista traduceri in diferite limbi; in tabela ‘tezaur’ sunt grupate, in jurul unui concept dintr-o anume limba, acele notiuni care sunt, intr-un grad mai mare sau mai mic, sinonime cu acesta; cum aria semantica a unui termen poate差别 de la o limba la alta, sinonimele nu sunt universal valabile, ci numai pentru o anume limba.

In tabela ‘dictionar’ sunt furnizate traduceri pentru toate conceptele, in toate limbile disponibile.

E nevoie sa se adauge automat, la adaugarea unei limbi sau a unui nou concept, inregistrari in tabela ‘dictionar’; acest proces este automatizat folosind doua trigger (declansatoare).

```
##-----  
## creare tabele limba, concept, tezaur, dictionar  
##-----  
create DATABASE IF NOT EXISTS d;  
USE d;  
DROP TABLE IF EXISTS limba;  
DROP TABLE IF EXISTS concept;  
DROP TABLE IF EXISTS tezaur;  
DROP TABLE IF EXISTS dictionar;  
  
CREATE TABLE IF NOT EXISTS limba  
(id int unique auto_increment primary key,  
nume char(20));  
  
CREATE TABLE IF NOT EXISTS concept  
(token_id char(20) unique primary key,  
descriere char(50));  
  
CREATE TABLE IF NOT EXISTS tezaur  
(id int unique auto_increment primary key,  
concept_token_id char(20),  
limba_id int,  
sinonim_token_id char(20),  
FOREIGN KEY (concept_token_id) REFERENCES concept(token_id),  
FOREIGN KEY (limba_id) REFERENCES limba(id),  
FOREIGN KEY (sinonim_token_id) REFERENCES concept(token_id));  
  
CREATE TABLE IF NOT EXISTS dictionar  
(id int unique auto_increment primary key,  
limba_id int,  
concept_token_id char(20),  
nume char(30),  
FOREIGN KEY (limba_id) REFERENCES limba(id),  
FOREIGN KEY (concept_token_id) REFERENCES concept(token_id));
```

# SQL

```
## - Trigger AFTER INSERT tabela concept
## Este folosit pentru a adauga automat traduceri in dictionar, dupa fiecare inserare a unui concept
## Pentru fiecare limba existenta, se adauga cate o traducere; traducerea va contine numai un cod
## care indica faptul ca acel termen nu e inca tradus
DROP PROCEDURE IF EXISTS CURSOR_LIMBA;

DELIMITER //

CREATE PROCEDURE CURSOR_LIMBA(new_token_id char(20))

BEGIN

DECLARE done INT DEFAULT 0;
DECLARE nId INT;
DECLARE cur1 CURSOR FOR SELECT id FROM limba;
DECLARE CONTINUE HANDLER FOR NOT FOUND SET done = 1;

OPEN cur1;

REPEAT
    FETCH cur1 INTO nId;
    IF NOT done THEN
        INSERT INTO dictionar (limba_id, concept_token_id, nume)
        VALUES(nId, new_token_id, '<enter text>');
    END IF;
UNTIL done END REPEAT;

CLOSE cur1;

END //
DELIMITER ;

DROP TRIGGER IF EXISTS insert_trad_dictionar;
delimiter //

CREATE TRIGGER insert_trad_dictionar AFTER INSERT ON concept
FOR EACH ROW BEGIN
    CALL CURSOR_LIMBA(NEW.token_id);
END; //

delimiter ;
```

Acest trigger se utilizeaza pentru a adauga inregistrari in tabela dictionar la adaugarea unui nou concept, cate o inregistrare pentru fiecare limba definita in tabela ‘limba’.

Procedura implementeaza cursorul pentru tabela ‘limba’; se parcurg toate inregistrarile tablei, si pentru fiecare inregistrare se adauga o noua inregistrare in tabela ‘dictionar’. In campul ‘nume’ unde se adauga traducerea propriu-zisa se introduce un cod cu semnificatia ‘traducere inexistentă’.

Trigger-ul apeleaza procedura CURSOR\_LIMBA.

# SQL

```
##-----  
DROP PROCEDURE IF EXISTS CURSOR_CONCEPT;  
  
DELIMITER //  
  
CREATE PROCEDURE CURSOR_CONCEPT(new_limba_id INT)  
  
BEGIN  
  
DECLARE done INT DEFAULT 0;  
DECLARE sId char(20);  
DECLARE cur2 CURSOR FOR SELECT token_id FROM concept;  
DECLARE CONTINUE HANDLER FOR NOT FOUND SET done = 1;  
  
OPEN cur2;  
  
REPEAT  
    FETCH cur2 INTO sId;  
    IF NOT done THEN  
        INSERT INTO dictionar (limba_id, concept_token_id, nume)  
        VALUES(new_limba_id, sId, '<enter text>');  
    END IF;  
UNTIL done END REPEAT;  
  
CLOSE cur2;  
  
END //  
DELIMITER ;  
  
## - Trigger AFTER INSERT tabela limba  
DROP TRIGGER IF EXISTS insert_limba_dictionar;  
  
delimiter //  
  
CREATE TRIGGER insert_limba_dictionar AFTER INSERT ON limba  
  
FOR EACH ROW BEGIN  
    CALL CURSOR_CONCEPT(NEW.id);  
END; //  
  
delimiter ;
```

Acest trigger se utilizeaza pentru a adauga inregistrari in tabela ‘dictionar’ la adaugarea unei noi limbi, cate o inregistrare pentru fiecare concept definit in tabela ‘concept’.

Procedura implementeaza cursorul pentru tabela ‘concept’; se parcurg toate inregistrarile tablei, si pentru fiecare inregistrare se adauga o noua inregistrare in tabela ‘dictionar’. In campul ‘nume’ unde se adauga traducerea propriu-zisa se introduce un cod cu semnificatia ‘traducere inexistentă’.

Trigger-ul apeleaza procedura CURSOR\_CONCEPT.

# SQL

```
##-----  
## inserare date in tabelele de limba, concept, tezaur, dictionar  
##-----  
  
insert into limba  
(nume)  
VALUES  
('Romana'),  
('Engleza'),  
('Franceza'),  
('Germana');  
  
INSERT INTO concept  
(token_id,descriere)
